

Straight-Line Graphs

Answer sheet · 26 marks total

Section A — Reading gradient and y-intercept

A1. **6** (1) A2. **-4** (1) A3. **-2** (1) A4. **9** (1)

Section B — Finding the gradient from two points

B1. $(10-2) \div (3-1) = 8 \div 2 = \mathbf{4}$ (1)

B2. $(-1-7) \div (4-0) = -8 \div 4 = \mathbf{-2}$ (1)

B3. $(4-(-4)) \div (1-(-3)) = 8 \div 4 = \mathbf{2}$ (1)

Section C — Tables and equations from data

C1. y-values: -5, -2, 1, 4 (1) points: (-1,-5), (0,-2), (1,1), (2,4) (1) all lie on a straight line (1)

C2. gradient = $(5-(-1)) \div (3-0) = 6 \div 3 = 2$ (1) y-intercept $c = -1$ (from $x=0$) (1) = **$y = 2x - 1$** (1)

Section D — Parallel lines and forming equations

D1. parallel $\rightarrow$ gradient = 4 (1) using (0,6): $c = 6 \rightarrow \mathbf{y = 4x + 6}$ (1)

D2. both lines have gradient 3 (1) so **yes**, they are parallel (1)

D3. gradient = $(13-5) \div (6-2) = 8 \div 4 = 2$ (1) substitute (2,5): $5 = 2(2) + c$ (1) $5 = 4 + c \rightarrow c = 1$ (1) = **$y = 2x + 1$** (1)

D4. substitute $x = 3$: $y = 2(3) + 1 = 7$ (1) matches the given y-value, so **yes**, the point lies on the line (1)

Marking note: award method marks for a correctly substituted gradient formula or correctly identified gradient/intercept, even if the final answer contains an arithmetic error.
