

Human Body Systems: Digestion & Control

Test · 37 marks total

Name: _____

Date: _____

Score: _____ / 37

Section A — Digestion & enzymes

A1. Name the organ that produces bile.

[1 mark]

A2. Complete: an enzyme is a _____ that speeds up a reaction without being used up.

[1 mark]

A3. Name the three digestive enzymes covered in this lesson, and state what each one breaks food down into.

[6 marks]

A4. Explain two roles of bile in digestion.

[4 marks]

Section B — The nervous system

B1. A stimulus is detected by a receptor and a response is produced by an effector. Name, in order, the three types of neuron involved in a reflex arc between these two points.

[3 marks]

B2. What is a synapse?

[2 marks]

B3. Explain why reflexes are useful to the body.

[2 marks]

B4. Explain why reflex responses are faster than responses that involve conscious thought.

[2 marks]

Section C — The endocrine system

C1. What is a hormone?

[2 marks]

C2. Name the gland often described as the "master gland".

[1 mark]

C3. Name the hormone that reduces blood glucose concentration, and the organ that produces it.

[2 marks]

C4. State two differences between nervous and hormonal communication.

[4 marks]

Section D — Apply it

D1. A person accidentally touches a hot iron and pulls their hand away before they feel any pain. Using your knowledge of the reflex arc, explain why this response happens so quickly.

[3 marks]

D2. Explain why someone whose pancreas is damaged might have unusually high blood glucose levels after eating a meal.

[3 marks]
